Product

Product description:

Alvdal Royal is manufactured by a two stage wood-processing method. Firstly the wood is preserved with a copper-based preservative system and then followed by a hot oil treatment under vacuum. The water is evaporated to a point where the water content of the product is satisfactory for installation. The linseed oil is absorbed into all surfaces of the wood. The Royal oil can contain pigments to provide a colouring effect to the product.

Royal-impregnated timber complies with durability class 1 to fungal attack. Royal-impregnation reduces the moisture absorption into the wood and prevents crack formation. The timber is Nordic solid wood of pine.

Product specification:

Royal-impregnated timber is supplied as cladding, roof, construction wood, laths and decking. A cubic meter is used as unit to represent various dimensions and products of Royal-impregnated timber.

| Materials | kg | % |
|-----------------------------------|--------|-----------|
| Wood, pine, dry weight | 435 | 81.1 |
| Water content of wood | 78.3 | 14.6 |
| CU-impregnation agent, dry weight | 4.5 | 0.8 |
| Royal oil and pigments | 18.55 | 3.5 |
| Total, product | 536.35 | ######### |
| Plastic packaging | 0.63 | |
| Steel packaging | 0.31 | |
| Total, with packaging | 537.29 | |

Technical data:

The declared unit consist of wood with a dry density of 435 kg/m3. At 18 % timber moisture the density is 513.3 kg/m3.

Cladding is produced according to NS-EN 14915, construction wood according to NS-EN 14081 and decking according to SN/TS 3188.

Alvdal Skurlag AS is member of Norwegian Control Scheme for Preservative Treated Wood (Norsk Impregneringskontroll).

Market:

Norway

Reference service life:

The reference service life of the Royal-impregnated cladding is minimum 60 years and depends on climatic conditions effects from external factors. Used as decking, the service life is 30 years.

LCA: Calculation rules

Declared unit:

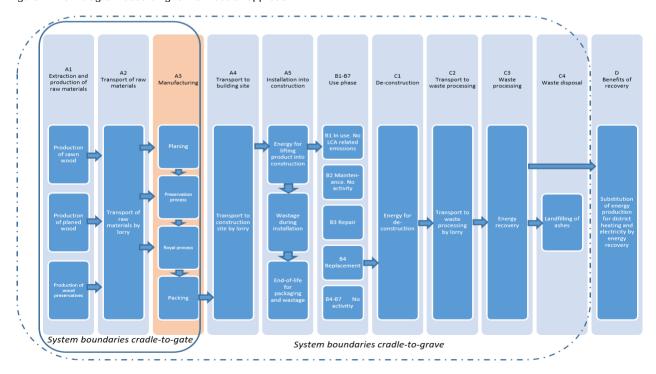

Production of 1 m³ Royal-impregnated timber of pine.

System boundary:

A flow chart with the system boundaries are shown bellow in figure 1.

Module D is calculated based on exported energy from waste processing substituting average electricity and district heating production.

Figure 1: Flow diagram according to the modular approach.

Data quality:

Manufacturing data for the issued product is based on average data for 2017. The data used for the production of sawn wood is based on NEPD-307-179 and with Ecoinvent v3.4 as background data. Data for the production of Royal oil and the copper impregnation agent are specific data which has been collected in a former EPD project. Data for exported energy from waste processing are based on Statistics Norway which is representative for 2017 (2018a, b, c). The rest of the data is from Ecoinvent v3.4, "Allocation cut-off by classification" (2017), but has been adjusted to improve representativeness.

Cut-off criteria:

All major raw materials and all the essential energy is included. The production process for raw materials and energy flows that are included with very small amounts (<1%) are not included. This cut-off rule does not apply for hazardous materials and substances. The production facility in A3 has been initially excluded from the study.

Allocation:

The allocation is made in accordance with the provisions of EN 15804. Incoming energy, water and waste production are subdivided when possible and allocated with economic allocation when the difference in revenue is high. Effects of primary production of recycled materials allocated to the main product in which the material was used. Economic allocation between saw logs and pulp wood for transport and logging activities is used in forestry.

Calculation of biogenic carbon content:

Sequestration and emissions of biogenic carbon is calculated according to EN16485:2014. This approach is based on the modularity principle in EN15804:2012 wich states that all environmental aspects and impacts are declared in the life cycle where they appear. The calculation of biogenic carbon content and conversion to carbon dioxide is done according to NS-EN 16449:2014. Net contribution to GWP from biogenic carbon by each module is shown on page 8. The timber originates from sustainable forestry and has PEFC certified traceability.

LCA: Scenarios and additional technical information

The following information describes the scenarios in the different modules of the EPD.

It is assumed a transport distance of 330 km from manufacturing to the building site. 300 km is assumed to be on a large size lorry and 30 km on a medium size lorry.

Transport from production place to user (A4)

| Туре | Capacity utilisation (incl. return) % | Type of vehicle | Distance km | Fuel/Energy | |
|-------|---------------------------------------|----------------------|-------------|--------------|--|
| | Capacity dimodilori (moi. retarri) 70 | | | consumption | |
| Lorry | 53 | EURO 5, >32 tonnes | 300 | 0.0228 l/tkm | |
| Lorry | 26 | EURO 5, 16-32 tonnes | 30 | 0.048 l/tkm | |

The assembly at building site includes 5 % product wastage, energy for lifting and waste management of packaging and wastage.

There are no LCA-related impacts during use phase. Copper-impregnated timber exposed to rain or cleaning has a leaching of 5-10% of the copper content (Evans, 2010). Leaching tests is not mandatory in EPD until measuring test methods has been harmonized.

Assembly (A5)

| | Unit | Value |
|---------------------------------------|----------------|-------|
| Auxiliary | kg | |
| Water consumption | m ³ | |
| Electricity consumption | MJ | 1.00 |
| Other energy carriers | MJ | |
| Material loss | kg | 26.8 |
| Output materials from waste treatment | kg | 0.94 |
| Dust in the air | kg | |

Use (B1)

| | Unit | Value |
|--------------------|------|-------|
| Leaching of copper | kg | <0,1 |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

It is assumed 5 applications of Royal oil, in total 22,5 kg during the reference service lifetime. 10 % of the product is assumed to be replaced. Prior to each application of Royal oil the surface is cleaned with water and detergent.

The product used as cladding does not require replacement during its lifetime. It is assumed one replacement for the product used as decking.

Maintenance (B2)/Repair (B3)

| | Unit | Value |
|---|----------------|-------|
| Maintenance cycle* | | 10 |
| Auxiliary | kg | 0.114 |
| Other resources - Royal oil per application | kg | 4.5 |
| Water consumption - per application | m ³ | 2.28 |
| Electricity consumption | kWh | 0 |
| Other energy carriers | MJ | 0 |
| Material loss | kg | 53.64 |

The product has no operational energy use or water consumption.

Replacement (B4)/Refurbishment (B5)

| | Unit | Value |
|---------------------------|------|-------|
| Replacement cycle* | | 30/60 |
| Electricity consumption | kWh | 0 |
| Replacement of worn parts | 0 | 0 |
| | | |
| | | |

* Number or RSL (Reference Service Life)

Copper impregnated wood waste is classified as treated wood (1142) according to NS 9431:2011, but in a case of doubt is is treated as CCA impregnated wood (7098). The waste processing is assumed as wood waste treated with incineration with energy recovery. Ash from incineration is disposed in landfill.

Operational energy (B6) and water consumption (B7)

| | Unit | Value |
|---------------------------|----------------|-------|
| Water consumption | m ³ | |
| Electricity consumption | kWh | |
| Other energy carriers | MJ | |
| Power output of equipment | kW | |
| | | |
| | | |

End of Life (C1, C3, C4)

| | Unit | Value |
|---------------------------------------|------|--------|
| Hazardous waste disposed | kg | |
| Collected as mixed construction waste | kg | 536.35 |
| Reuse | kg | |
| Recycling | kg | |
| Energy recovery | kg | 536.35 |
| To landfill | kg | |

The transport of wood waste is based on average distance for Norway in 2007 and was 85 km (Raadal et al., 2009).

Transport to waste processing (C2)

| Туре | Capacity utilisation (incl. return) % | Type of vehicle | Distance km | Fuel/Energy consumption | |
|-------|---------------------------------------|-----------------|-------------|-------------------------|--|
| Lorry | Unspecified | Unspecified | 85 | 0.045 l/tkm | |

The benefits of exported energy from energy recovery is calculated with substitution of Norwegian electricity market mix on medium voltage and Norwegian district heating mix. The energy exported and the district heating mix is representative for the year 2017.

Benefits and loads beyond the system boundaries (D)

| | | u | |
|----------------------------------|------|----------|---------|
| | Unit | Cladding | Decking |
| Substitution of electricity | MJ | 948 | 1710 |
| Substitution of district heating | MJ | 6520 | 11759 |
| Substitution of raw materials | ka | 0 | 0 |

LCA: Results

The results for global warming in A1-A3 includes 797.5 kg of sequestration of carbon dioxide during wood growth, while the same amount gives an large contribution when emitted during waste treatment in C3. The amount of net contribution of biogenic carbon to each module is shown on page 8.

Decking:

The product used as decking includes replacement in module B4. This provides an impact to the results for waste treatment and is therefore reported separately in module D.

CR Components for reuse; MR Materials for recycling; MER Materials for energy recovery; EEE Exported electric energy; ETE Exported thermal energy

Reading example: $9.0 \text{ E}-03 = 9.0 \cdot 10^{-3} = 0.009$

Additional Norwegian requirements

Greenhouse gas emission from the use of electricity in the manufacturing phase

National production mix with import, on low voltage (production of transmission lines, in addition to direct emissions and losses in grid) is applied for electricity in the manufacturing process (A3).

| Data source | Amount | Unit |
|------------------------------|--------|-------------------------------|
| Ecoinvent v3.4 (August 2017) | 31.0 | gram CO ₂ -eqv/kWh |

Dangerous substances

- ☐ The product contains no substances given by the REACH Candidate list or the Norwegian priority list
- The product contains substances given by the REACH Candidate list or the Norwegian priority list that are less than 0.1 % by weight.
- ☐ The product contain dangerous substances, more then 0.1% by weight, given by the REACH Candidate List or the Norwegian Priority list, see table.
- The product contains no substances given by the REACH Candidate list or the Norwegian priority list. The product is classified as hazardous waste (Avfallsforskiften, Annex III), see table.

Transport

Transport from production site to a construction site according to scenario A4:

330 km

Indoor environment

There has not been performed tests for emission to indoor environment since the products is intended for outdoor use.

Carbon footprint

To increase the transparency of the climate impacts, the GWP indicator has been divided into sub-indicators:

GWP-IOBC Climate impacts calculated according to instant oxidation principle

GWP-BC Climate impacts calculated from the net impacts of sequestration and emission of biogenic carbon

| Climate im | Climate impact | | | | | | | | | |
|------------|-------------------------|-----------|----------|-----------|----------|----------|-----------|-----------|----------|--|
| Parameter | Unit | A1-A3 | A4 | A5 | B1 | B2 | B3 | B4 | B5 | |
| GWP-IOBC | kg CO ₂ -eqv | 1.38E+02 | 1.66E+01 | 1.01E+01 | 0.00E+00 | 2.13E+01 | 2.11E+01 | 2.11E+02 | 0.00E+00 | |
